

Housing

April 26, 2021

1 Chapter 2 - End-to-End Machine Learning Project

1.1 Get the data

1.1.1 Download housing Data

```
[1]: import os
import tarfile
import urllib

DOWNLOAD_ROOT = "https://raw.githubusercontent.com/ageron/handson-ml2/master/"
HOUSING_PATH = os.path.join("datasets", "housing")
HOUSING_URL = DOWNLOAD_ROOT + "datasets/housing/housing.tgz"

def fetch_housing_data(housing_url=HOUSING_URL, housing_path=HOUSING_PATH):
    os.makedirs(housing_path, exist_ok=True)
    tgz_path = os.path.join(housing_path, "housing.tgz")
    urllib.request.urlretrieve(housing_url, tgz_path)
    housing_tgz = tarfile.open(tgz_path)
    housing_tgz.extractall(path=housing_path)
    housing_tgz.close()

fetch_housing_data()
```

1.1.2 Load the data

```
[2]: import pandas as pd

def load_housing_data(housing_path=HOUSING_PATH):
    csv_path = os.path.join(housing_path, "housing.csv")
    return pd.read_csv(csv_path)

housing = load_housing_data()
```

1.1.3 Visualize Data structure

```
[3]: housing.head()
```

```
[3]:   longitude  latitude  housing_median_age  total_rooms  total_bedrooms  \
0    -122.23    37.88             41.0         880.0         129.0
1    -122.22    37.86             21.0        7099.0        1106.0
2    -122.24    37.85             52.0        1467.0         190.0
3    -122.25    37.85             52.0        1274.0         235.0
4    -122.25    37.85             52.0        1627.0         280.0

1.1.7 Plotting histogram

```
[7]: %matplotlib inline
import matplotlib.pyplot as plt
housing.hist(bins=50, figsize=(20,15))
plt.show()
```

1.2 Creating a test set

```
[8]: import numpy as np

def split_train_test(data, test_ratio):
    np.random.seed(42)
    shuffled_indices = np.random.permutation(len(data))
    test_set_size = int(len(data) * test_ratio)
    test_indices = shuffled_indices[:test_set_size]
    train_indices = shuffled_indices[test_set_size:]
    return data.iloc[train_indices], data.iloc[test_indices]
```

```
train_set, test_set = split_train_test(housing, 0.2)
```

We can use Scikit-Learn functions to split datasets into multiple subsets

```
[9]: from sklearn.model_selection import train_test_split

train_set, test_set = train_test_split(housing, test_size=0.2, random_state=42)
```

1.2.1 Creating a stable test set, using instance identifier

```
[10]: from zlib import crc32

def test_set_check(identifier, test_ratio):
    return crc32(np.int64(identifier)) & 0xffffffff < test_ratio * 2 **32

def split_test_set_by_id(data, test_ratio, id_column):
    ids = data[id_column]
    in_test_set = ids.apply(lambda id_: test_set_check(id_, test_ratio))
    return data.loc[~in_test_set], data.loc[in_test_set]

housing_with_id = housing.reset_index()

# housing_with_id["id"] = housing["longitude"] * 1000 + housing["latitude"]

train_set, test_set = split_test_set_by_id(housing_with_id, 0.2, "index")
```

Using Scikit-Learn to generate test set

```
[11]: from sklearn.model_selection import train_test_split

train_set, test_set = train_test_split(housing, test_size=0.2, random_state=42)
```

Creating income category attribute with five categories

```
[12]: housing["income_cat"] = pd.cut(housing["median_income"], bins=[0., 1.5, 3.0, 4.5, 6., np.inf], labels=[1, 2, 3, 4, 5])

housing["income_cat"].hist()
```

```
[12]: <AxesSubplot:>
```

Doing stratified sampling

```
[13]: from sklearn.model_selection import StratifiedShuffleSplit

split = StratifiedShuffleSplit(n_splits=1, test_size=0.2, random_state=42)

for train_index, test_index in split.split(housing, housing["income_cat"]):
    strat_train_set = housing.loc[train_index]
    strat_test_set = housing.loc[test_index]
```

Looking at the income category proportions in the test set

```
[14]: strat_test_set["income_cat"].value_counts() / len(strat_test_set)
```

```
[14]: 3    0.350533
      2    0.318798
      4    0.176357
      5    0.114583
      1    0.039729
      Name: income_cat, dtype: float64
```

Removing the income_cat attribute so the data is back to its original state

```
[15]: for set_ in (strat_train_set, strat_test_set):
      set_.drop("income_cat", axis=1, inplace=True)
```

1.3 Discover and Visualize the Data to Gain Insights

1.3.1 Visualizing Geographical Data

```
[16]: housing = strat_train_set.copy()

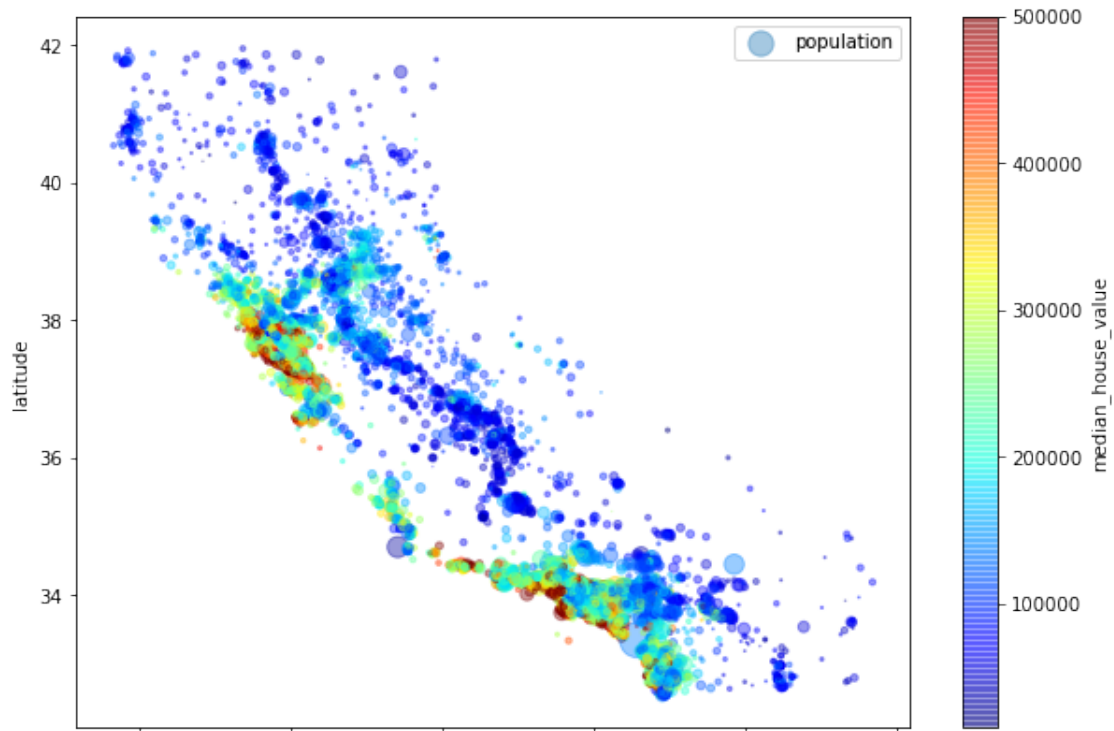

housing.plot(kind="scatter", x="longitude", y="latitude", alpha=0.1)

housing.plot(
    kind="scatter",
    x="longitude",
    y="latitude",
    alpha=0.4,
    s=housing["population"]/100,
    label="population",
    figsize=(10,7),
    c="median_house_value",
    cmap=plt.get_cmap("jet"),
    colorbar=True,
)

plt.legend()
```

[16]: <matplotlib.legend.Legend at 0x7f15541408d0>

1.3.2 Looking for Correlations

```
[17]: corr_matrix = housing.corr()

corr_matrix["median_house_value"].sort_values(ascending=False)
```

```
[17]: median_house_value    1.000000
median_income              0.687160
total_rooms                0.135097
housing_median_age         0.114110
households                 0.064506
total_bedrooms             0.047689
population                 -0.026920
longitude                  -0.047432
latitude                   -0.142724
Name: median_house_value, dtype: float64
```

```
[18]: from pandas.plotting import scatter_matrix

attributes = ["median_house_value", "median_income", "total_rooms",
             ↪ "housing_median_age"]
```

```
scatter_matrix(housing[attributes], figsize=(12, 8))
```

```
housing.plot(kind="scatter", x="median_income", y="median_house_value",  
alpha=0.1)
```

[18]: <AxesSubplot:xlabel='median_income', ylabel='median_house_value'>

1.3.3 Experimenting with Attribute Combinations

```
[19]: housing["rooms_per_household"] = housing["total_rooms"]/housing["households"]
housing["bedrooms_per_room"] = housing["total_bedrooms"]/housing["total_rooms"]
housing["population_per_household"]=housing["population"]/housing["households"]

corr_matrix = housing.corr()

corr_matrix["median_house_value"].sort_values(ascending=False)
```

```
[19]: median_house_value      1.000000
median_income                0.687160
rooms_per_household          0.146285
total_rooms                  0.135097
housing_median_age           0.114110
households                   0.064506
total_bedrooms               0.047689
population_per_household    -0.021985
population                   -0.026920
longitude                   -0.047432
latitude                    -0.142724
bedrooms_per_room           -0.259984
Name: median_house_value, dtype: float64
```

1.4 Prepare the Data for Machine Learning Algorithms

```
[20]: housing = strat_train_set.drop("median_house_value", axis=1)
housing_labels = strat_train_set["median_house_value"].copy()
```

1.4.1 Data Cleaning

```
[21]: median = housing["total_bedrooms"].median()
housing["total_bedrooms"].fillna(median, inplace=True)
```

Data cleaning with Scikit-Learn

```
[22]: from sklearn.impute import SimpleImputer

imputer = SimpleImputer(strategy="median")
housing_num = housing.drop("ocean_proximity", axis=1)
imputer.fit(housing_num)

print(imputer.statistics_)
print(housing_num.median().values)

X = imputer.transform(housing_num)
housing_tr = pd.DataFrame(X, columns=housing_num.columns, index=housing_num.
    ↪index)
```

```
[-118.51    34.26    29.    2119.5    433.    1164.    408.
   3.5409]
[-118.51    34.26    29.    2119.5    433.    1164.    408.
   3.5409]
```

1.4.2 Handling Text and Categorical Attributes

```
[23]: housing_cat = housing[["ocean_proximity"]]
housing_cat.head(10)
```

```
[23]:      ocean_proximity
17606      <1H OCEAN
18632      <1H OCEAN
14650      NEAR OCEAN
3230       INLAND
3555      <1H OCEAN
19480      INLAND
8879      <1H OCEAN
13685      INLAND
4937      <1H OCEAN
```

4861 <1H OCEAN

Converting categories from text to numbers

```
[24]: from sklearn.preprocessing import OrdinalEncoder

ordinal_encoder = OrdinalEncoder()
housing_cat_encoded = ordinal_encoder.fit_transform(housing_cat)
print(housing_cat_encoded[:10])
print(ordinal_encoder.categories_)

[[0.]
 [0.]
 [4.]
 [1.]
 [0.]
 [1.]
 [0.]
 [1.]
 [0.]
 [0.]]
[array(['<1H OCEAN', 'INLAND', 'ISLAND', 'NEAR BAY', 'NEAR OCEAN'],
      dtype=object)]
```

Creating a one-hot encoding

```
[25]: from sklearn.preprocessing import OneHotEncoder

cat_encoder = OneHotEncoder()
housing_cat_1hot = cat_encoder.fit_transform(housing_cat)
housing_cat_1hot
housing_cat_1hot.toarray()
cat_encoder.categories_

[25]: [array(['<1H OCEAN', 'INLAND', 'ISLAND', 'NEAR BAY', 'NEAR OCEAN'],
      dtype=object)]
```

1.4.3 Custom Transformers

```
[26]: from sklearn.base import BaseEstimator, TransformerMixin

rooms_ix, bedrooms_ix, population_ix, households_ix = 3, 4, 5, 6

class CombinedAttributesAdder(BaseEstimator, TransformerMixin):
    def __init__(self, add_bedrooms_per_room = True):
        self.add_bedrooms_per_room = add_bedrooms_per_room
    def fit(self, X, y=None):
```

```

        return self
    def transform(self, X):
        rooms_per_household = X[:, rooms_ix] / X[:, households_ix]
        population_per_household = X[:, population_ix] / X[:, households_ix]
        if self.add_bedrooms_per_room:
            bedrooms_per_room = X[:, bedrooms_ix] / X[:, rooms_ix]
            return np.c_[X, rooms_per_household, population_per_household,
→bedrooms_per_room]
        else:
            return np.c_[X, rooms_per_household, population_per_household]

attr_adder = CombinedAttributesAdder(add_bedrooms_per_room=False)
housing_extra_attribs = attr_adder.transform(housing.values)

```

1.4.4 Transformation Pipelines

```

[27]: from sklearn.pipeline import Pipeline
      from sklearn.preprocessing import StandardScaler

num_pipeline = Pipeline([
    ('imputer', SimpleImputer(strategy="median")),
    ('attribs_adder', CombinedAttributesAdder()),
    ('std_scaler', StandardScaler()),
])

housing_num_tr = num_pipeline.fit_transform(housing_num)

```

A single transformer able to handle all columns, applying the appropriate transformations to each column

```
